WORK EXPERIENCE

AUXILO | Sr. Software Engineer (Backend Lead)

Mumbai, India | Sep 2025 – Present

- Lead backend architecture, API development, database design, and code reviews across End-Use, Appway, and Salesforce projects using Python, FastAPI, PostgreSQL, MongoDB, and AWS; mentor three developers.
- Implemented AWS-based CI/CD pipelines for Dockerized backend applications, automating build and deployment workflows using AWS services and server-side deployment scripts.
- **End-Use Monitoring:** Designed and developed a post-disbursement loan monitoring platform with configuration-driven workflows, maker-checker approvals, RBAC, audit trails, idempotent operations, and transaction-safe balance management.
- **Appway Loan Onboarding:** Developed backend APIs for user authentication, email/mobile verification, CKYC retrieval, digital consent, and application-form generation.
- Improved system reliability using Redis, RabbitMQ, distributed locks, asynchronous workers, token caching, configurable concurrency, retries, stale-job recovery, encrypted S3 logs, and SNS alerts.
- **AI Decision Support:** Built a production Amazon Bedrock-powered service that analyzes structured education-loan data and generates validated JSON scores and recommendations for human review.
- **Salesforce Document Archival:** Processed 830K+ documents (316 GB), validating DMS copies using SHA-256 before S3 backup and safe Salesforce deletion. Automated 10K-document batches in 50–60 minutes with failure tracking and recovery.
- **Salesforce Data Retention:** Cleared a 2.1M-record backlog using AWS AppFlow, S3, Glue Crawlers, Apache Iceberg, Athena, and Parquet; automated backup validation and safe data purging for subsequent batches.

TIPSTAT | Sr. Software Engineer

Bengaluru, India | Dec 2024 – Sep 2025

- **Overseas Loan Application:** Owned backend architecture, database design, implementation, deployment, and related **DevOps** for a platform covering application submission, OCR-based data verification, and Salesforce synchronization.
- Built FastAPI and PostgreSQL services with **Redis**, **RabbitMQ**, S3, and **background workers** for applicant and co-applicant registration, KYC, academics, finances, banking, documents, consent, and final submission.
- Integrated **Salesforce**, **DigiLocker**, **Karza KYC**, **GLIB OCR**, bank verification, and **email/SMS/WhatsApp** services with **retries**, **token renewal**, standardized errors, and OpenAPI/Swagger documentation.
- Secured sensitive PII using **AES-256 encryption**, **JWT/OTP authentication**, **role-based access**, CSRF/CORS controls, S3 presigned URLs, and Aadhaar masking.
- **ImpactX Scholarship Program**: Integrated **Astute Address** Verification APIs, processed asynchronous callbacks, and built API- and Excel-based loading for historical applications.
- **AI Sentiment Analysis:** Built a production advisory service that classified home-visit comments and questionnaire responses as positive, neutral, or negative for reviewer consideration, while keeping final decisions human-controlled.

CRED (Happay) | SDE 1

Bengaluru, India | Mar 2022 – Aug 2024

- Built **role-based** customer dashboards with **drill-down** views and **granular** charts using **Django, PostgreSQL** and **MongoDB** simplifying access to operational insights.
- **Optimized analytics** and detailed-data **APIs** through **query improvements**, **database indexing**, redundant-work removal, and **pagination**, reducing response times from **500–800 ms** to **200–400 ms.**
- **Improved AWS ETL transformation** logic, cutting more than **4 hours per batch** and saving **approximately 120+ compute hours** per month.

- Built an **AWS Lambda**, **SQS**, and **SES notification system** that delivered **email** and **SMS notifications** to **6,000+ users per minute** with a **concurrency limit of 100**
- Automated AWS Batch and Lambda data-load monitoring with notification logs, reducing manual verification effort by 90%.

CLEVERTAP | SDE Intern

Mumbai, India | Mar 2021 – Sep 2021

- Automated user lifecycle operations for Zoom, Miro, and Slack through Terraform providers, reducing manual administration effort by more than 90%.
- Worked with Golang, REST APIs, and AWS services including EC2, S3, VPC, security groups, and IAM.

SKILLS

Languages & Frameworks: Python, FastAPI, Django/DRF, SQLAlchemy, Alembic, Golang, C/C++, JS
Databases & Messaging: PostgreSQL, MongoDB/DocumentDB, Redis, RabbitMQ, SQS
AWS & Data: S3, Lambda, AppFlow, Glue, Athena, Apache Iceberg, Parquet, ECR, CloudWatch, SNS, Secrets Manager
DevOps & Delivery: Docker, Nginx, CodePipeline, CodeBuild, CodeDeploy, GitHub Actions, CI/CD
Backend Engineering: System design, microservices, asynchronous processing, OpenAPI/Swagger, code reviews, database Query Optimization, JWT/OTP, RBAC, AES-256 encryption, distributed locking, idempotency, observability
Integrations: Salesforce, DigiLocker, CKYC, Karza, GLIB OCR, Astute, eSign, document management systems
AI Development Tools: Codex, Claude Code—codebase analysis, code review, security/edge-case analysis, and test-input simulation

PROJECTS

Recorzo - Finance Record Management

Tech: FastAPI, Docker, PostgreSQL, SQLAlchemy, React, LLM API

- Built a multi-user financial platform that imports bank statements, **prevents duplicate transactions**, h**ighlight missing transactions**, reconciles running balances, and provides interactive cash-flow analytics.
- Implemented **rule-based** and **AI-assisted transaction categorization** that learns from user corrections, **reuses confirmed mappings**, and routes uncertain suggestions for manual review to improve accuracy over time.

Distributed Backup & Restore Engine

Tech: FastAPI, Docker, AWS

- Built a backup system that divides selected files into independently restorable archive parts and maintains an index mapping each original file to its corresponding archive, enabling selective restoration without downloading the complete backup.
- Supports parallel transfers across multiple network connections
- Aggregated storage across multiple Amazon S3, Google Drive, and OneDrive accounts, with resumable parallel transfers across available network connections for faster uploads and downloads.

Universal Media Downloader

Tech: Python, FastAPI, asyncio, yt-dlp

- Built a web download manager that discovers downloadable media and available formats, processes downloads through a persistent background queue, and provides real-time progress, speed, ETA, retry, and restart recovery.
- The service supports video/media URLs through yt-dlp and HLS—not every arbitrary web file.

EDUCATION

B.TECH IN CSE (IIIT Nagpur)

Nagpur, Maharashtra | June-2021
